

NEW CONSTRUCTION COMPLETED IN CALTHA

What will it be?

Since Monday, the building in FitzStreet in Caltha is completed. What exactly would happen to the building was still unknown. But today, the city has communicated its plans. The building will become the new main lab of our pharmaceutical industry.

Vetus Novus's pharmaceutical knowledge has further developed as compared to the rest of the world. A new discovery was made in the red blood cells of elderly people, which enables scientists to develop a medicine that can optimise their resistance. Of course, this hypothesis requires a lot of research, which is why the government constructed this building.

Caltha is the Silicon Valley of the pharmaceutical industry. The main building was already there, but will now be expanded and move a few streets further. The building will not only be used for research into these red blood cells, but also for research into making cancer less deadly, treating the after-effects of corona and so forth.

The government has also invested a major budget in the exterior and interior of the building. The architectural firm opted for a classic and professional look from the street side, but a breathtaking view as soon as you enter the building.

At the moment, they are still in the process of relocating so that they will be fully established there within a month. The city of Caltha also announces that this will certainly not be the only new building to enhance the city's high brand value. We are curious to see what the building will look like in real life, which will be added to our already impressive architecture.
